

Week task 1

Deploy application in monolithic and microservice architecture

Deploy wordpress and mysql on the same instance

1. We are going to use a web server named Apache
2. We need a database which is mysql
3. We are going to install wordpress
 - Create an AWS account.
 - Launch instance .
 - I assigned an elastic ip to get static ip address to my website.
 - Connect to the instance .
 - I installed apache web server on my instance.
 - I also install php run time on my instance . After that i installed mysql server for database.

- Now i configure mysql authentication plugin to `mysql_native_password` to login.
- I download wordpress tar file and extracted it.
- Now i changed the inbound rules of my instance and connected my wordpress website
